The sequence of 32 kb on the left arm of yeast chromosome Xi
reveals 14 open reading frames among which HSP104, SSA2,
SPA2, KNS1, DPS1/APS, SDC25, a new member of the
seripauperins family and a new ABC transporter homologous
to the human multidrug resistance protein.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    SCD25 protein (version 2) - yeast (Saccharo protein L1309; protein YLLO16w #formal_name Saccharomyces cerevisiae 01-aug-1995 #sequence_revision 24-May-1996

Title:

Description: Perfect Score: >US-09-422-999-18 (1-849) from US09422999.pep 6222

Sequence: 1 MYLWKRALTMTGFLTRRTHL.....VIDNQRTLSQMSHRLEPRRP 849

Scoring table: PAM 150 Gap 11

Searched: 134018 seqs, 13297625 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-issued 1:5A_COMB 2:5B_COMB 3:6_COMB 4:PCT9_COMB 5:backfiles1

Statistics: Mean 36.052; Variance 179.682; scale 0.201

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

MPsrch_pp protein - protein database search, using Smith-Waterman algorithm

Tabular output not generated. Run on: Sat Apr 22 13:17:33 2000; MasPar time 44.93 Seconds 447.554 Million cell updates/sec

Title:

Description: Perfect Score:

Sequence: >US-09-422-999-18 (1-849) from US09422999.pep 6222 1 MYLMKRALIMTGFLIRRTHL.....VIDNQRTLSQMSHRLEPRRP 849

Scoring table: PAM 150 Gap 11

188963 seqs, 23686106 residues

Post-processing: Minimum Match 0% Listing first 45 summaries

Database: a-geneseq36 1:geneseqp

Statistics: Mean 38.706; Variance 183.913; scale 0.210

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                               New peptide(s) modulating GDP exchange in complexes - with ras protein and derived antibodies, nucleic acid etc. esp. for diagnosis and treatment of cancer claim 2; Page 23-24; 46pp; French.

The peptide antagonises the interaction of GDP-exchange factor with the p21-GDP complex and thereby regulates the activity of spene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be use the coding sequence can be used to interactive the coding sequence.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  The peptide antagonises the interaction of GDP-exchange factor (GI with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expressions of the coding sequence can be used to produce antisense products which can inhibit oncogene expressions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              (RHON) RHONE POULENC RORER Schweighoffer F, Tocque B; WPI; 93-351724/44.

The peptide antagonises the interaction of GDP-exchange fact with the p21-GDP complex and thereby regulates the activity gene products. It can also be used to identify other compour which can modulate GDP exchange. The coding sequence can be to produce antisense products which can inhibit oncogene expands of use in diagnosis e.g. detecting (over)expression of

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  diagnosis and treatment of cancer Claim 2; Page 32-34; 46pp; French.
The peptide antagonises the interaction of GDP-exchange factor (GRF with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for the contract of the contra
                                                                                                                                                                 The mammalian son of sevenless gene has been found to have homology with various guanine exchange factors, suggesting a possible role in protein tyrosine kinase pathways via the Ras proteins. Mutations in the genes and consequently their products may result in specific defects or tumour formation. Antagonists to the protein/gene may used to treat conditions arising from mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                    DNA encoding mammalian son of seven-less gene and proteins encoded by it - regulates tyrosine kinase signalling pathway ras proteins, may be used for diagnosis and therapy of genetics.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          (FLOR-) FLOREY INST

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The peptide antagonises the interaction of GDP-exchange factor (GRF) with the p21-GDP complex and thereby regulates the activity of ras gene products. It can also be used to identify other compounds which can modulate GDP exchange. The coding sequence can be used to produce antisense products which can inhibit oncogene expression and for use in diagnosis e.g. detecting (over)expression of GRF for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           N-PSDB; Q51234.

New peptide(s) modulating GDP exchange in complexes - protein and derived antibodies, nucleic acid etc. esp. diagnosis and treatment of cancer Claim 2; Page 28-29; 45pp; French.
                           DNA encoding mammalian son of seven-less gene and proteins encoded by it - regulates tyrosine kinase signalling pathway via ras proteins, may be used for diagnosis and therapy of genetic

                                                          Detection of agents that modify BCR-ABL mediated transformation useful in treatment of leukaemia and other malignancies Disclosure; Page 54-59; 106pp; English.

Mouse mSOS1 (R84638) is a Ras guanine nucleotide releasing protein that combines with BCR-ABL and Grb2 (R84636) to activate the Ras pathway leading to morphological transformation. The SH3 domains of Grb2 associate the the proline-rich domains of mSOS1 and mSOS2 (R84639). Synthetic peptides (R84640-48) based on these motifs can be used to screen for compounds that affect BCL-ABL mediated transformation. Such compounds have value in the treatment of chronic, acute myelogenous or acute lymphocytic leukaemia. Sequence 1336 AA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Claim 4; Figure 1; 78pp; English.

The mammalian son of sevenless gene has been found to have homology with various quanine exchange factors, suggesting a possible role in protein tyrosine kinase pathways via the Ras proteins. Mutations in the genes and consequently their products may result in specific defects or tumour formation. Antagonists to the protein/gene may be used to treat conditions arising from mutations.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    mSOS1 protein.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Biochemical markers of human endometrium - useful for, e.g. diagnosis of hyperplasia and adenocarcinoma Disclosure; Page 19-20; 77pp; English. Proteins w54349-W54364 are examples of proteins produced in the endometrium during the hyperplasia, adenocarcinoma or proliferative phase of the endometrium. The presence and quantities of these proteins can be detected using 2D gel electrophoresis comparison of cell lysates. The proteins can be used as biochemical markers to detect the phase of the endometrium and can be measured in body fluids, obviating the need for endometrial biopsies.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      W54350

The present sequence represents a MCG7 protein. The protein has gene regulatory functions, and has homology to a heat shock protein or heat shock-binding protein. The specification also describes MCG4, which is homologous to guanine nucleotide exchange factor protein, and MCG18, which is homologous to a zinc finger protein.

Detection of mutations in the MCG genes can be used to identify the propensity for various types of cancer, and to treat, arrest, or otherwise ameliorate, the effects of a cancer in an animal or bird.

The specification also describes MCG4, which is homologous to guanine nucleotide exchange factor protein, and MCG18, which is homologous to a zinc finger protein.

Detection of mutations in the MCG genes can be used to identify the propensity for various types of cancer, and to treat, arrest, or
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   23-MAY-1997; AU-006973.

                                                                                                                                                                                                                                                                per Determining effect on signalling pathways in live cells from redistribution of luminophores - specifically fusions of green fluorescent protein with a signalling component, and new apparatus, per particularly for identifying toxins and potential therapeutic agents Example 10; Pages 281-283; 326pp; English.

The present sequence represents a human PKG-green fluorescent protein (GFP) fusion protein. The fusion protein is used in an assay to exemplify the invention. The specification describes how quantitative information about the influence of a molecule on a cellular response is obtained by recording the variation, caused by the molecule on mechanically intact living cells, in the spatially distributed light emitted from a luminophore present in the cells. The variation in light distribution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, especially to screen for potential therapeutic agents or toxins, and to identify new drug targets.

PT redistribution of luminophores - specifically fusions of green redistribution of luminophores - specifically fusions of green fluorescent protein with a signalling component, and new apparatus, per particularly for identifying toxins and potential therapeutic agents per particularly for identifying toxins and potential therapeutic agents for protein 10; Pages 274-276; 326pp; English.

CC PKG fusion protein. The fusion protein is used in an assay to complify the invention. The specification describes how quantitative information about the influence of a molecule on a cellular response is contained by recording the variation, caused by the molecule, on mechanically intact living cells, in the spatially distributed light emitted from a luminophore present in the spatially distributed light cemission is processed to provide information that correlates spatial constitution to the degree of the molecule. The method is used to identify agents that (in)directly affect intracellular signalling, contained to the specially to screen for potential therapeutic agents or toxins, and to
                                                                                                                                                                                                                                    Matches
                                                                                                                                                                                                                                                       Query Match
